Uppsala 2012

1457
ISO/IEC 17043

All analytical activities require the execution of work of a high standard that is accurately documented. For this purpose most laboratories carry out some form of internal quality assurance, but their analytical work also has to be evaluated by an independent party. Such external quality control of laboratory competence is commonly required by accreditation bodies and can be done by taking part in proficiency testing (PT).

In a proficiency test, identical test material is examined by a number of laboratories. The laboratories must follow instructions, perform analyses on the samples provided and report their results to the organiser. They are also expected to use their routine methods to analyse the samples provided. The organiser subsequently evaluates the results using statistical tools and finally compiles them in a report.

Purpose of the National Food Agency's proficiency tests

1. Laboratories are externally evaluated with respect to their analytical competence, including usage of methods, documentation and orderliness.
2. Accreditation bodies are provided with a tool for inspections regarding new accreditation or maintenance of accreditation.
3. Laboratories and the organiser improve their knowledge of the efficiency of analytical methods used routinely by participating laboratories with respect to various types of organisms.

Design and analyses

The proficiency testing reported in this document was performed during October 2012 and is registered as no. 2822/2012 at the National Food Agency, Uppsala.

Analyses performed

- Quantitative analyses

Aerobic microorganisms, 30°C and 20°C

Contaminating microorganisms

Enterobacteriaceae

Coliform bacteria, 30°C and 37°C

Thermotolerant coliform bacteria

Escherichia coli

Presumptive *Bacillus cereus*

Coagulase-positive *Staphylococci*

Enterococci

- Qualitative analysis

Gram-negative bacteria in pasteurized milk and cream. Detection of recontamination.

Test material

Each laboratory received three freeze-dried microbial mixtures designated A-C. The manufactured test material was freeze-dried in portions of 0.5 ml in vials, as described by Peterz and Steneryd (1). Before analysing the samples, the contents of each vial had to be dissolved in 254 ml of diluent. The organisms present in the mixtures are listed in Table 1.

Table 1. Microorganisms present in mixture A-C supplied to participants

Mixture ¹	Microorganism	Strain no.
A	<i>Aeromonas caviae</i>	SLV-206
	<i>Enterobacter cloaceae</i>	SLV-011
	<i>Bacillus cereus</i> group (atypical)	SLV-517
	<i>Enterococcus durans</i>	SLV-078
B	<i>Micrococcus</i> sp.	SLV-055
	<i>Proteus vulgaris</i>	SLV-476
	<i>Enterococcus faecalis</i>	SLV-051
C	<i>Micrococcus</i> sp.	SLV-055
	<i>Escherichia coli</i>	SLV-524
	<i>Bacillus cereus</i> group	SLV-518
	<i>Staphylococcus aureus</i>	SLV-280

¹The links between the mixtures and the randomised sample numbers are shown in Appendix 1

Quality control of the mixtures

It is essential to have homogeneous mixture and uniform volume in all vials in order to allow comparison of all freeze-dried samples from one mixture. Quality control was performed in conjunction with manufacture of the mixtures according to Scheme Protocol (2). The results are presented in Table 2. Homogeneity requires that the standard deviation and the difference between the highest and lowest value of results from 10 samples analysed do not exceed 0.15 log₁₀ units and 0.5 log₁₀ units, respectively.

Table 2. Concentration mean (*m*) and standard deviation (*s*) from analyses of 10 randomly selected vials per mixture, expressed in log₁₀ cfu (colony forming units) per ml of sample.

Laboratory results

General information regarding the results

Samples were sent to 223 laboratories, 54 in Sweden, 153 in other European countries, and 16 outside Europe. 214 laboratories reported results, 108 (50%) provided at least one result that received an annotation. In the previous round (October 2011) with similar analyses, the proportion was 46%.

Highly deviating values that did not belong to a strictly normal distribution were identified as statistical outliers (Grubbs' test modified by Kelly (3)). In some cases, subjective adjustments were made to set limits, based on knowledge of the mixture's contents. Outliers and false results were not included in the calculations of means and standard deviations. Results reported as “>value” were excluded from the evaluation. Results reported as “<value” were interpreted as being zero (negative result). All reported results are presented in Appendix 1.

Description of mixture A

Mixture A contained *Aeromonas caviae*, *Enterobacter cloaceae*, presumptive *Bacillus cereus* group, and *Enterococcus durans*

Table 3. Outcome of each analysis for mixture A

Analysis	Organism	m ^a	s ^b	F+	F-	Outl<	Outl>	n ^c

F+ and F-: numbers of false positive and false negative results, respectively.

Outl < and Outl >: number of low and high outliers, respectively.

- : no target organism, () : false positive organism in a presumptive analysis

Aerobic microorganisms 30°C and 20°C

The colonies counted for these analyses are mainly from the strains of *Aeromonas caviae* and *Enterococcus durans* present in the mixture at the highest concentration. Some colonies were quite small after incubation at 30 or 20°C and were counted under magnifier at National Food Agency. The small colonies could explain the dispersion of the results and the deviating results obtained.

Contaminating microorganisms

As for the analysis of aerobic microorganisms, colonies are mainly from the strains of *A. caviae* and *E. durans*. Only 27 laboratories performed this analysis. The average value is slightly lower than for the total count of aerobic microorganisms. No confirmation step is required for this analysis according to standard method ISO 13559:2002/IDF 153:2002, but a catalase test can be performed. Both catalase-positive and catalase-negative microorganisms present in mixture A form colonies on SFA, which could explain the dispersion of the results depending if all or only catalase negative colonies were counted.

Enterobacteriaceae, coliform bacteria 30°C and 37°C

Mixture A contained a strain of *Enterobacter cloaceae* which forms typical colonies on VRBG and VRB medium. Few laboratories reported divergent results for these analyses. Indeed, other colonies appeared on these media but they were atypical and differentiate from enterobacteriaceae and coliforms bacteria in the confirmations tests (oxidase-positive and no fermentation of lactose in BGB)

Thermotolerant coliform bacteria and Escherichia coli

Mixture A did not contain any strain of *E. coli* or thermotolerant coliform however five and six false positive results were obtained for these analyses, respectively. The strain of *E. cloaceae* can form colonies if plates are incubated at a temperature slightly below 44°C and be therefore misjudged as thermotolerant coliform bacteria. It is worth noticing that all laboratories that reported false positive results for the analysis of thermotolerant coliform bacteria reported an absence of *E. coli* in the mixture, indicating a correct interpretation of the confirmation steps. Concerning the *E. coli* analysis, none of the laboratories that reported a false positive result had carried out the analysis of thermotolerant coliform bacteria; moreover the analysis was performed at a temperature below 44°C and / or did not include confirmations steps.

Presumptive Bacillus cereus

The strain included in mixture A belongs to *B. cereus* group and was isolated from a cream sauce that caused food poisoning. This strain forms atypical colonies, shiny with a small haemolysis zone on BA medium. On Mossel/MYP-agar and BcS, colonies appear pink and light blue, respectively and on both media the precipitation zone is weak or even absent. 53 laboratories reported a false negative result for this analysis. No correlation between method and false results can be established.

Due to the high difficulty of the analysis, the results are not evaluated and therefore no z-score will be calculated. Moreover, these results are not taken into account in the tables under the box plots.

Coagulase-positive Staphylococci

Mixture A did not contain any target organism for this analysis and did not cause any major problem.

Enterococci

Mixture A contained a strain of *Enterococcus durans* which forms typical colonies on Slanetz-Bartley medium and is positive for esculine hydrolysis. However, 11 laboratories reported a false negative result and several reported outliers results.

Gram-negative bacteria in pasteurized milk and cream. Detection of recontamination

E. cloaceae was the target organism for this analysis. Only eleven results were reported, among which two false negative.

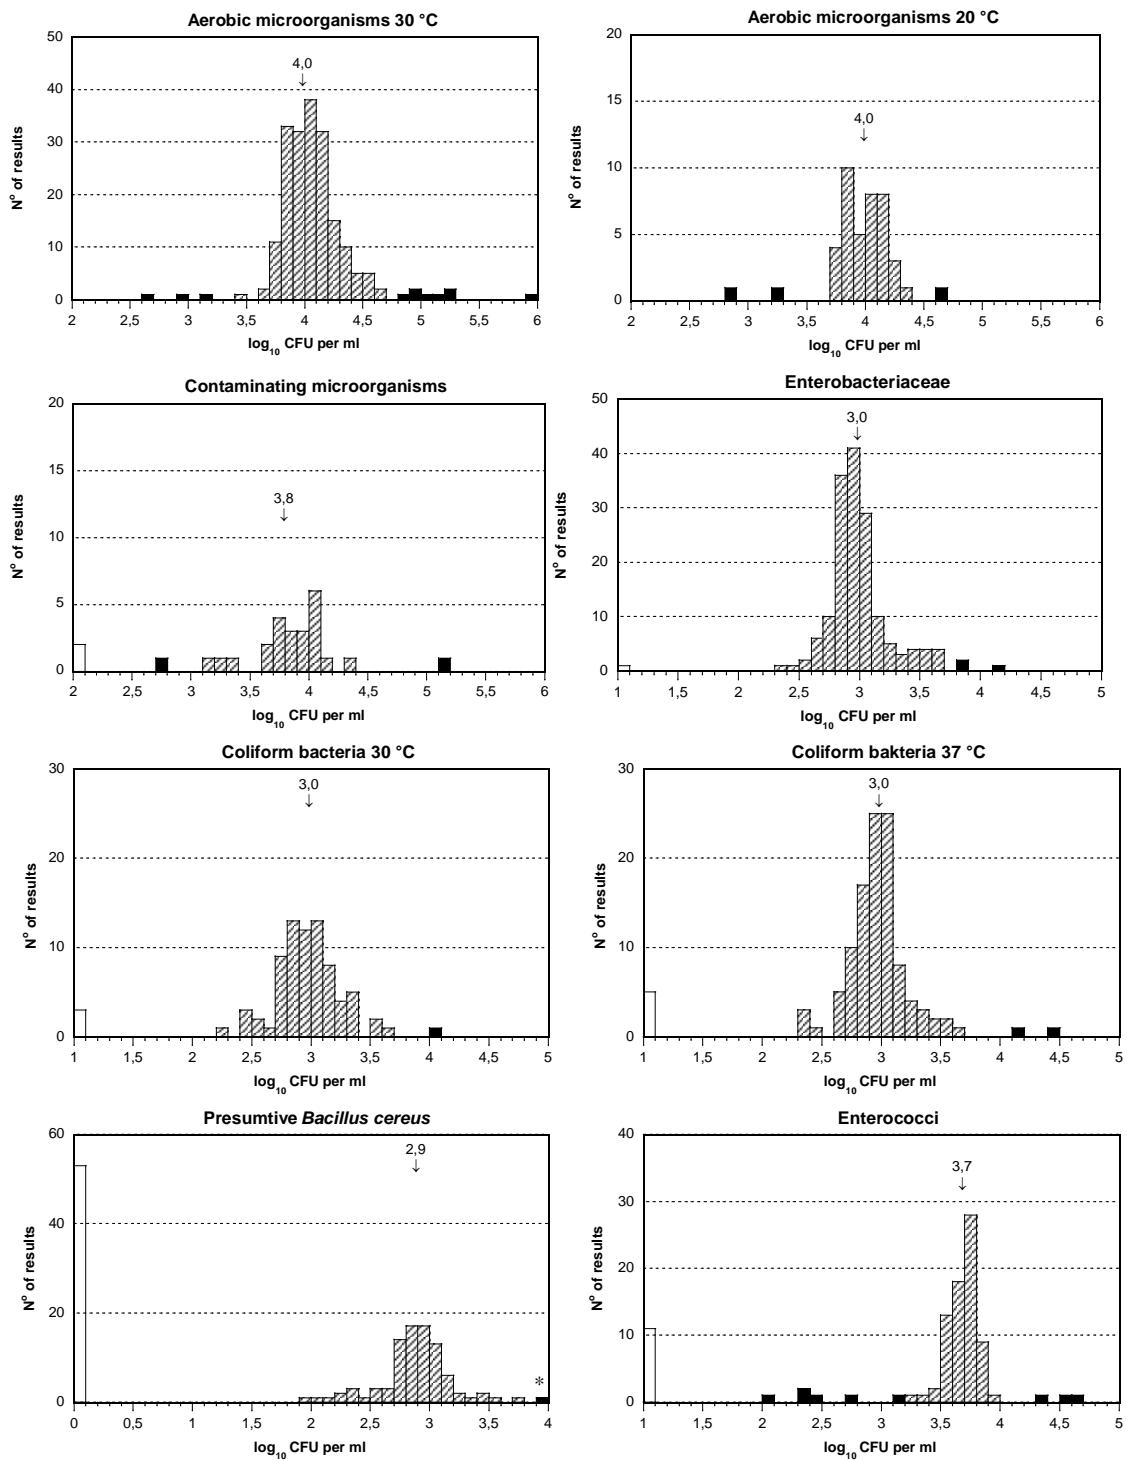

Figure 1. Histograms of all analytical results obtained for the mixture A.

▨ values within the interval of acceptance (Appendix 1), ■ outliers, □ false negative results, * outliers outside of the x-axis scale. The mean value of the analysis results is indicated in the histograms

Description of mixture B

Mixture B contained *Micrococcus* sp., *Proteus vulgaris* and *Enterococcus faecalis*.

Table 4. Outcome of each analysis for mixture B

Analysis	Organism	m ^a	s ^b	F+	F-	Outl<	Outl>	n ^c

^a mean value and standard deviation of laboratory results expressed in log₁₀ cfu/ml (Appendix 1)

^b standard deviation of laboratory results

^c number of analyses performed

F+ and F-: numbers of false positive and false negative results, respectively.

Outl < and Outl>: number of low and high outliers, respectively.

- : no target organism

(): false positive organism in a presumptive analysis

Aerobic microorganisms 30 °C and 20 °C

Micrococcus and *P. vulgaris* were the two microorganisms at the higher concentration in mixture B. The participants results are quite spread for both analyses with a long tail of lower results for the count of aerobic microorganisms at 30°C. This outcome can be explained by the use of different methods and/or substrate and is discussed further in the section “outcome of the methods”

Contaminating microorganisms

As for the analysis of aerobic microorganisms, colonies are mainly from the strains of *Micrococcus* and *P. vulgaris*. Few laboratories participate in this analysis and, like for mixture A, the results are quite spread without any obvious main peak. This can be linked to the swarming characteristic of *P. vulgaris* colonies which makes difficult the plate reading.

Enterobacteriaceae

P. vulgaris was the target organism for this analysis which present only few difficulties.

Thermotolerant coliform bacteria and Escherichia coli

Mixture B did not contain any strain of *E. coli* or thermotolerant coliform and only four false positive results were obtained for the analysis of *E. coli*.

Coliform bacteria 30 °C and 37 °C

Mixture B did not contain any coliform bacteria but a strain of *P. vulgaris* which forms very small colonies without precipitation zone on VRB agar. Moreover, in the confirmation step, *P. vulgaris* does not produce gas in BGB and can therefore be distinguished from coliform bacteria. However, 34 laboratories reported a false positive result for this analysis at 30°C, 37°C or both temperatures. This indicated that colonies of *P. vulgaris* were considered as coliform bacteria and that the confirmation step failed or was not performed.

Presumptive Bacillus cereus

Mixture B did not contain any presumptive *B. cereus* but the *P. vulgaris* strain which forms swarming colonies on Blood agar could make difficult the reading of the plates. However, *P. vulgaris* grows on MYP medium forming *B. cereus*-like colonies which could explained that seven laboratories reported a false positive result.

Coagulase-positive Staphylococci

No coagulase positive *Staphylococci* was present in mixture B, but the strain of *P. vulgaris* which forms black colonies with a surrounding zone on BP-agar can be misinterpreted as *Staphylococcus*. However, these bacteria can be differentiated from each other in the confirmation step of the analysis: *P. vulgaris* is coagulase-negative. On BP-agar with RPF, *P. vulgaris* forms colonies without any zone and cannot therefore be misinterpreted as a coagulase-positive *Staphylococcus*. Many laboratories (~10%) reported a false positive result, 10 of them used BP-agar or3 PetrifilmTM Staph.

Enterococci

Enterococcus faecalis was the target organism for this analysis. Several laboratories reported outliers but no explanation could be found from the method information given by the participants.

Gram-negative bacteria in pasteurized milk and cream. Detection of recontamination

P. vulgaris was the target organism for this analysis.

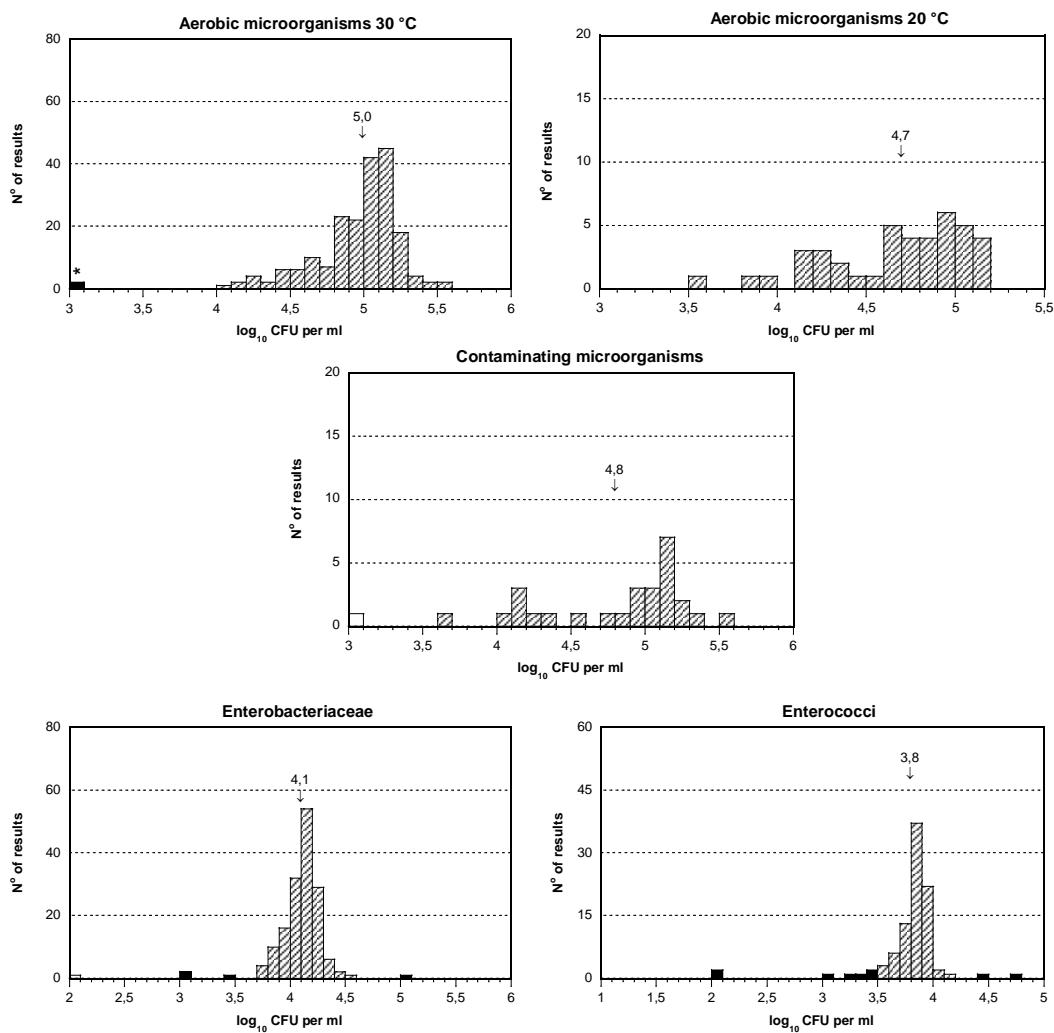

Figure 2. Histograms of all analytical results obtained for mixture B.
For details, see legend to Figure 1.

Description of mixture C

Mixture C contained *Micrococcus sp.*, *Escherichia coli*, presumptive *Bacillus cereus* and *Staphylococcus aureus*.

Table 5. Outcome of each analysis for mixture C

Analysis	Organism	m ^a	s ^b	F+	F-	Outl<	Outl>	n ^c

Enterococci	-	-	-	1	0	-	-	93
Gram negative bact. in dairy products	<i>E. coli</i>	pos	-	0	0	-	-	11

^a mean value and standard deviation of laboratory results expressed in log₁₀ cfu/ml (Appendix 1)

^b standard deviation of laboratory results

^c number of analyses performed

F+ and F-: numbers of false positive and false negative results, respectively.

Outl < and Outl>: number of low and high outliers, respectively.

- : no target organism

(): false positive organism in a presumptive analysis

Aerobic microorganisms

The organisms detected by these analyses were mainly *Micrococcus spp.* and *Staphylococcus aureus* which should not cause any particular difficulties. However, ten and four low outliers were obtained for the analysis of aerobic microorganisms at 30°C and 20°C, respectively. No method or medium could be linked to the low values obtained after incubation at 30°C. On the other hand, all participants who carried out the analysis at 20°C and used MPCA, obtained values regarded as low outliers for the mixture C.

Contaminating microorganisms

As for the analysis of aerobic microorganisms, colonies are mainly from the strains of *Micrococcus* and *S. aureus*. Few laboratories participate in this analysis and the results are quite spread without any obvious main peak.

Enterobacteriaceae, E. coli, thermotolerant coliform, and coliform bacteria 30 °C and 37 °C

The *E. coli* strain present in mixture C was the target organism for the five analyses, which is reflected by similar mean values obtained. The analysis of enterobacteriaceae did not revealed any difficulties. For the analysis of *E. coli*, 5 false negative and 10 low outliers results were reported. No obvious explanation for these results appeared when looking at the method or medium used by the participants. Concerning the analysis of coliform bacteria, at 30°C, the results are distributed in a wide peak, while at 37°C they separate in one major and one minor peak centered around 3.0 and 2.5, respectively. This distribution of the results could not be linked to the method and/or medium used for the analysis.

Presumptive *Bacillus cereus*

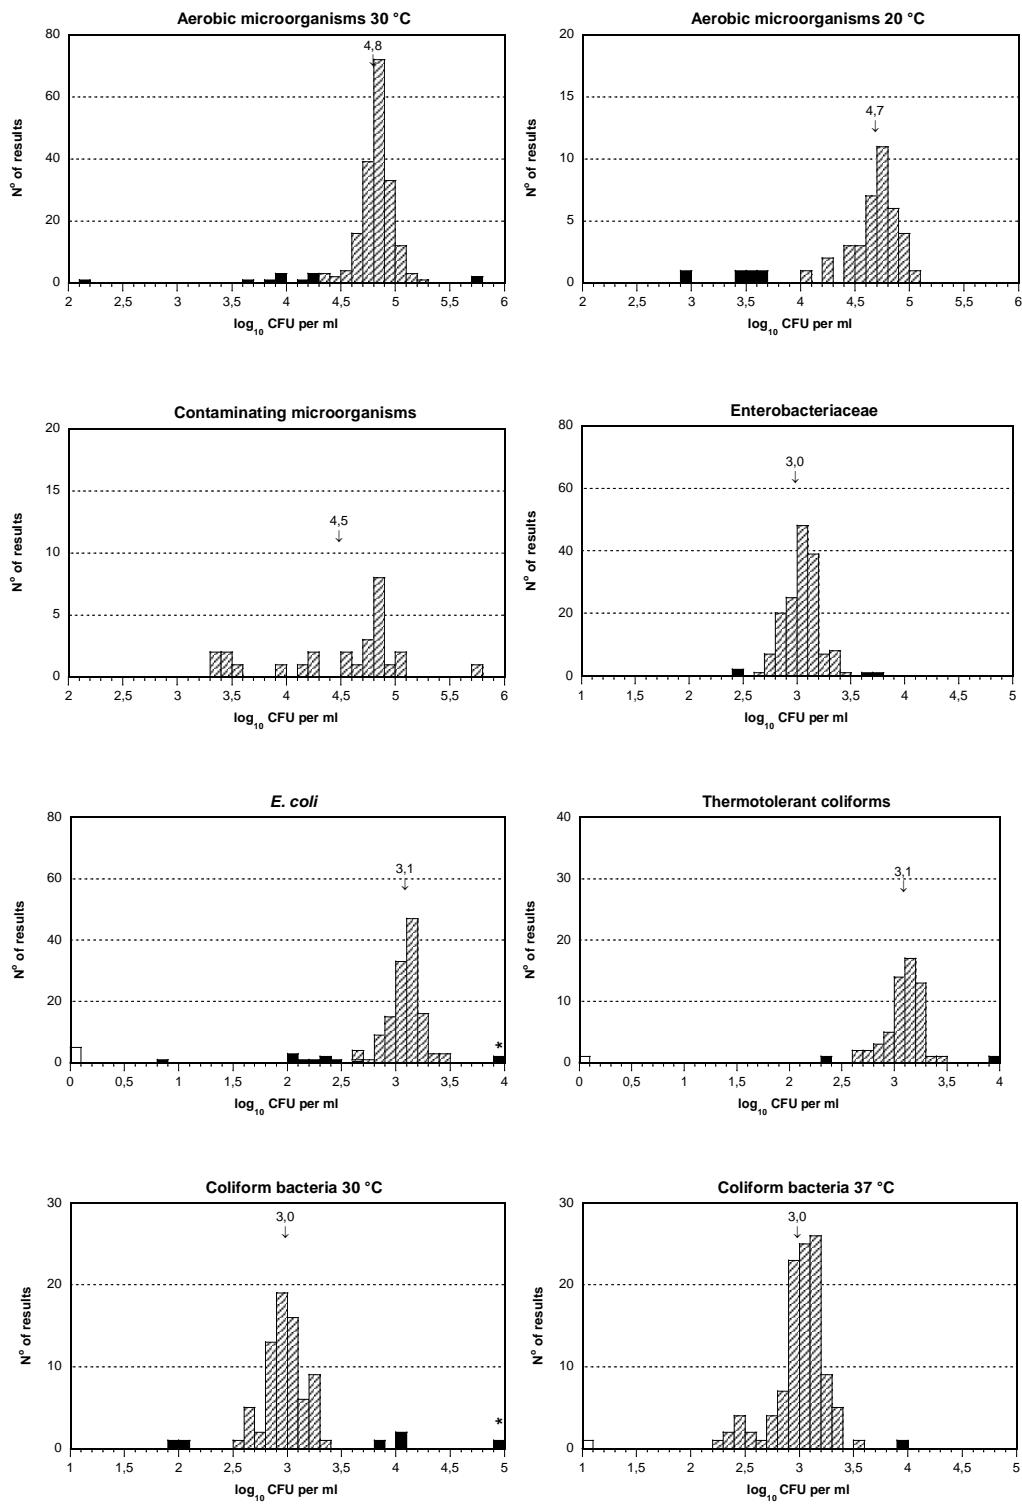

Mixture C contained a typical strain belonging to the *B. cereus* group. This strain forms typical colonies on BA, BcS and MYP media. For an unexplained reason, two false negative and eight outliers results were reported.

Coagulase-positive *Staphylococci*

Mixture C contained a strain of *S. aureus* which forms typical colonies on both BP and BP+RPF medium. On the former, the coagulase reaction is not tested directly on the plate and must be performed with rabbit plasma. On the latter, coagulase-positive strain form grey/black colonies surrounded by a precipitation halo. Some laboratories reported outliers results but none of them used BP+RPF. This suggest that the results interpretation was more difficult with other media or that the confirmation steps failed.

Gram-negative bacteria in pasteurized milk and cream. Detection of recontamination

E. coli was the target organism for this analysis.

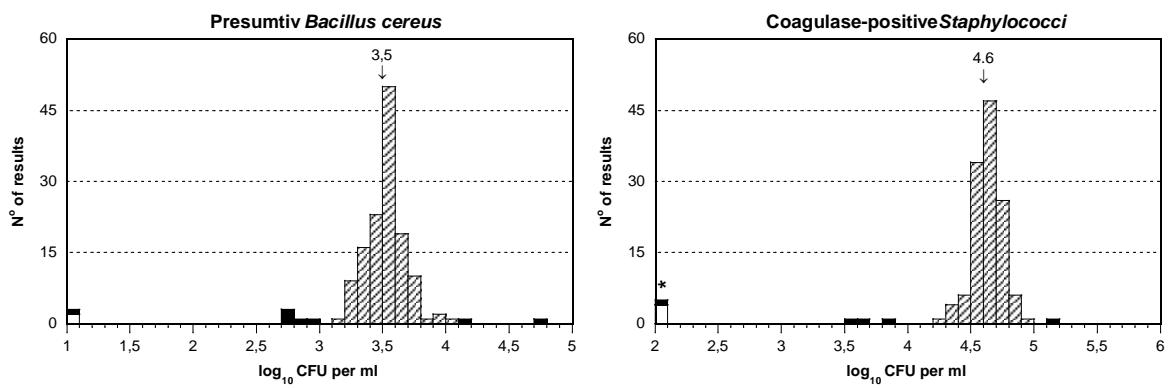

Figure 3. Histograms of all analytical results obtained for mixture C. For details, see legend to Figure 1.

Outcome of the methods

General comments

According to EN ISO/IEC 17043, for which the proficiency testing programme organised by the National Food Agency is accredited, it is mandatory for the participating laboratories to give method information for all analyses for which they report results. However, the method information is sometimes difficult to interpret, e.g. many laboratories choose a medium that differs from that in the reported standard methods. Therefore, first the distribution of methods used for each analysis is presented (Table 6). Thereafter, for each analysis, the results are divided according to the medium used.

In the tables of this section, the following symbols have been used:

- n amount of laboratory that performed the analysis
m mean value of laboratory results in \log_{10} cfu/ml (false results and outliers excluded)
s standard deviation of laboratory results
< amount of low outliers and false negative
> amount of high outliers
F+ amount of false positive

Table 6. Distribution of the methods used by the laboratories for each analysis.

Analys	n	NMKL	ISO/IDF	Petrifilm™	Other	Several
Aerob. microorg. 30°C	198	70	63	39	25	1

* NMKL-MPN (coliform 30°C, 37°C), NMKL and ISO-MPN-methods (coliform 44°C, *E. coli*) are included

Aerobic microorganisms

30°C	Mixture A					Mixture B					Mixture C				
	n	m	s	<	>	n	m	s	<	>	n	m	s	<	>
PCA	117	3.99	0.17	2	4	117	5.03	0.24	1	0	117	4.82	0.13	5	2
Petrifilm™	37	4.26	0.17	0	2	38	4.71	0.27	0	0	37	4.81	0.17	1	0
MPCA	25	4.01	0.20	0	2	25	5.02	0.18	0	0	25	4.84	0.18	1	0
TSA	9	4.03	0.14	0	0	9	4.96	0.22	0	0	9	4.89	0.15	1	0
Other	9	-	-	1	0	9	-	-	1	0	9	-	-	1	0
20°C	n	m	s	<	>	n	m	s	<	>	n	m	s	<	>
PCA	29	3.96	0.15	0	0	28	4.81	0.28	0	0	29	4.71	0.19	0	0
Petrifilm™	4	4.27	-	1	1	4	4.59	0.32	0	0	4	4.63	0.39	1	0
MPCA	3	3.90	-	1	0	3	3.78	0.17	0	0	3	-	-	3	0
Other	6	-	-	0	0	6	-	-	0	0	6	-	-	0	0

The results obtained for these analyses are similar but some trends are noticeable when using Petrifilm™, both at 30°C and 20°C: results are higher for mixture A, lower for mixture B and similar to the results obtained with other media for mixture C (Fig 4). For mixture A, some colonies were quite small, hence it is possible that the presence of tetrazolium in the Petrifilm™ facilitates their enumeration. The results for mixture B spread with a tail of lower values, mainly linked to the use of Petrifilm™. Mixture B contained *P. vulgaris*, forming swarming colonies that could render difficult the results interpretation.

Few laboratories performed the analysis at 20°C but , for the three mixtures, the use of MPCA led to results considered as low outliers and/or close to the lower limits of the interval of acceptance. This was not the case at 30°C.

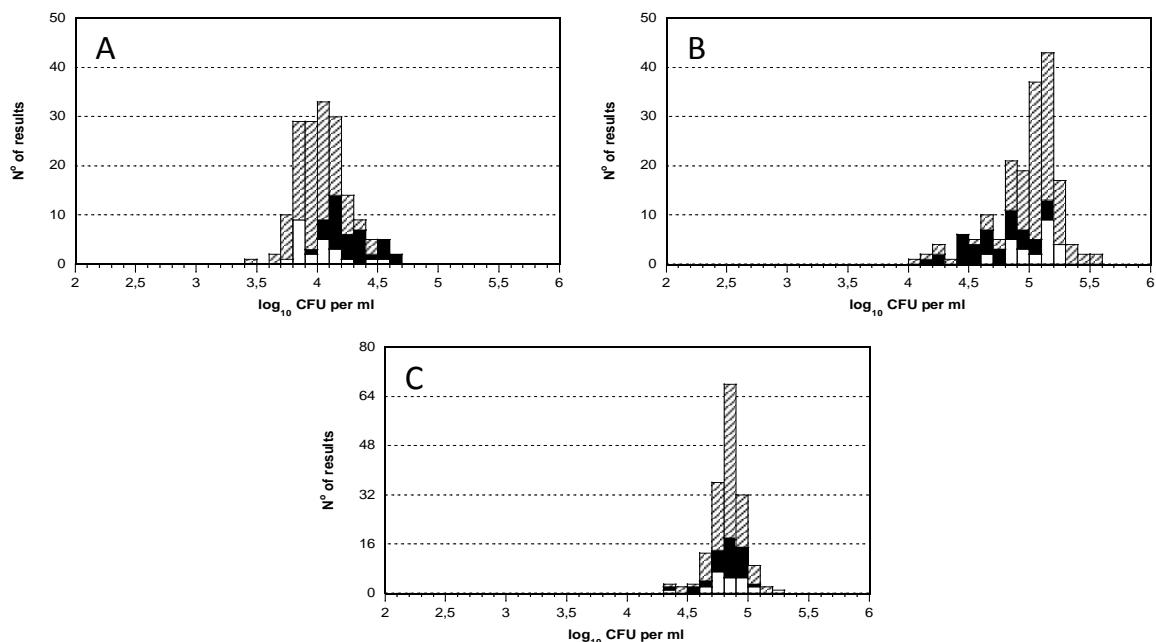

Figure 4. Analytical results of aerobic microorganisms at 30 °C for mixture A-C according to the medium used: ▨ PCA, □ MPCA, ■ Petrifilm™

Contaminating microorganisms

	Mixture A					Mixture B					Mixture C				
	n	m	s	<	>	n	m	s	<	>	n	m	s	<	>
SFA	22	3.81	0.29	2	0	23	4.75	0.49	1	0	22	4.36	0.59	0	0
MPCA	3	3.93	0.09	0	0	3	4.97	0.22	0	0	3	4.82	0.08	0	0
Other	2	-	-	1	1	2	-	-	0	0	2	-	-	0	0

Most of the laboratories that performed the analysis used SFA. The high standard deviations reflect the large spreading of the results. Due to their different size and/or morphology, colonies can be difficult to enumerate on this medium. Moreover, some laboratories performed confirmation tests and other not.

Enterobacteriaceae

Other	5	-	-	0	0	5	0	5	-	-	1	0

The different media used for these analyses led to similar results for mixture A and C, but approximately 30% of the laboratories that used VRB medium reported a false positive result for mixture B. An explanation for this outcome is the interpretation of *P. vulgaris* as coliform bacteria even though this strain forms very small colonies without precipitation zone on VRB agar.

Presumptive *Bacillus cereus*

	Mixture A					Mixture B		Mixture C				
	n	m	s	<	>	n	F+	n	m	s	<	>
BA	77	2.82	0.32	26	1	77	1	76	3.53	0.17	3	1
BA+P	5	2.89	0.13	1	0	5	0	5	3.52	0.23	0	0
BcS	4	2.82	-	2	0	4	1	4	3.50	0.11	0	0
BcS+P	13	2.93	0.32	2	0	13	0	13	3.48	0.14	1	1
Chrom	9	2.90	0.36	1	0	9	0	9	3.60	0.07	1	0
Mossel/MYP	33	2.89	0.17	20	0	33	5	33	3.47	0.13	3	1
Other	2	-	-	1	0	2	0	2	-	-	0	0

Most of the false negative results reported for mixture A were obtained with BA or Mossel/MYP but these media were also the most used. Therefore, the high amount of false negative results cannot be linked to a particular medium but is simply due to the atypical characteristics of the strain present in mixture A.

Coagulase-positive Staphylococci

	Mixture A		Mixture B		Mixture C				
	n	F+	n	F+	n	m	s	<	>
BP	82	2	82	10	82	4.62	0.11	5	1
BP+RPF	23	0	23	0	23	4.63	0.13	0	0
Petrifilm™	22	2	22	3	22	4.61	0.07	1	0
Other	7	0	8	1	7	-	-	2	0

None of the laboratories that used BP+RPF reported false positive or outliers results. This suggests that the direct test of coagulase reaction in BP+RPF makes the reading of the plate easier and diminishes the risk of misinterpretation.

Enterococci

	Mixture A					Mixture B					Mixture C	
	n	m	s	<	>	n	m	s	<	>	n	F+
S&B	78	3.66	0.13	17	1	78	3.84	0.10	6	1	78	1
TSA+S&B	6	3.67	0.09	0	1	6	3.90	0.06	0	0	6	0
Other	9	-	-	0	1	9	-	-	1	1	9	0

Almost all laboratories used S&B medium with or without pre-incubation in TSA. Although all false negative or low outliers are from analysis performed without pre-incubation, it is difficult to draw a conclusion as it concerns only six laboratories.

Gram-negative bacteria in pasteurized milk and cream. Detection of recontamination

The new standard method, NMKL 192:2011, describes a qualitative analysis for the detection of recontamination of dairy products by gram-negative bacteria. The method consists of a pre-incubation at 25C, 24h or at room temperature, 28h, followed by streaking 10 or 100µl of the sample on VRBG, respectively. Eleven laboratories performed this analysis and only two gave method information. The report of method information was not mandatory for this analysis.

General outcome of the results - assessment

In order to allow comparison of the results from different analyses and mixtures, all the results from quantitative analyses were transformed into standard values (z-scores). A z-score is either positive or negative, depending on whether the individual result is higher or lower than the mean value calculated from all laboratory results for each analysis. The z-scores obtained, which are listed in Appendix 2, can be used as a tool by laboratories when following up on the results.

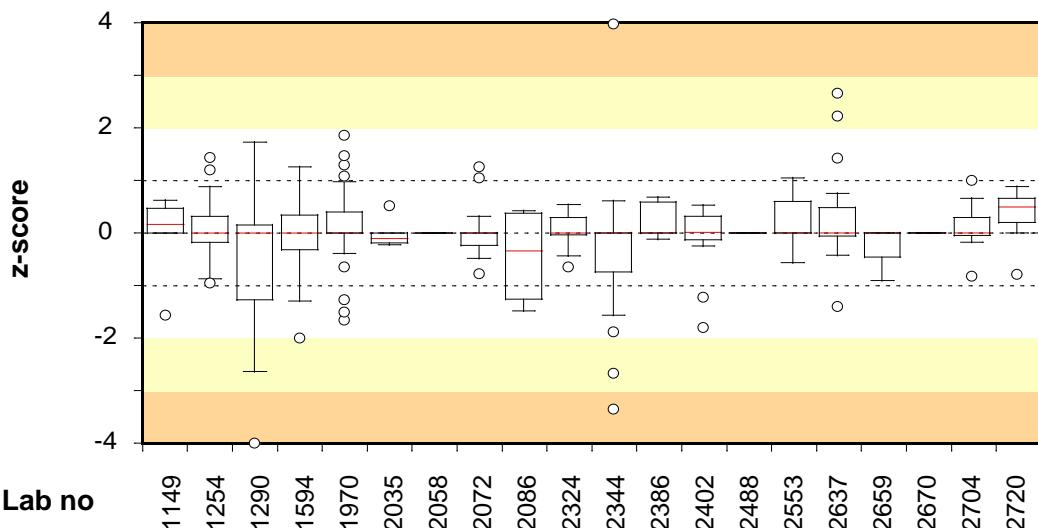

All the results from each laboratory – outliers included and false results excluded – were compiled into a box plot (Figure 5) based on their z-scores. The smaller and more centred round zero the box of a laboratory is, the closer its results are to the general mean values calculated for all laboratory results.

The laboratories were not grouped or ranked based on their results. However, for each laboratory, the number of false results and outliers is presented below the box plots. These results are also highlighted in Appendix 1, where all the reported results are listed, and the minimum and maximum accepted values for each analysis are stated.

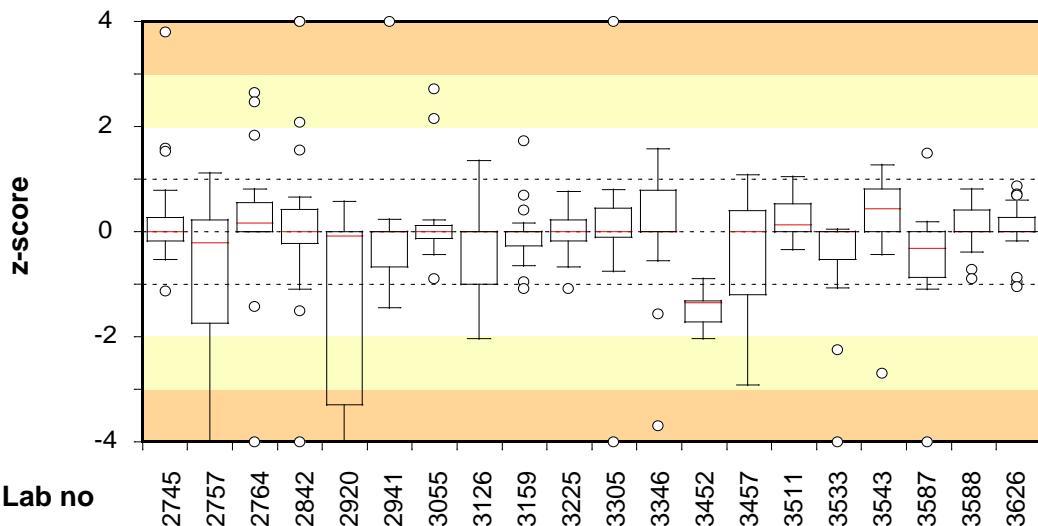

Information on the results processing and recommendations for follow-up work are given in the Scheme Protocol (2). Samples for follow-up can be ordered, free of charge, via our website:www.slv.se/pt_extra

Figure 5. Box plots and number of deviating results for each laboratory.

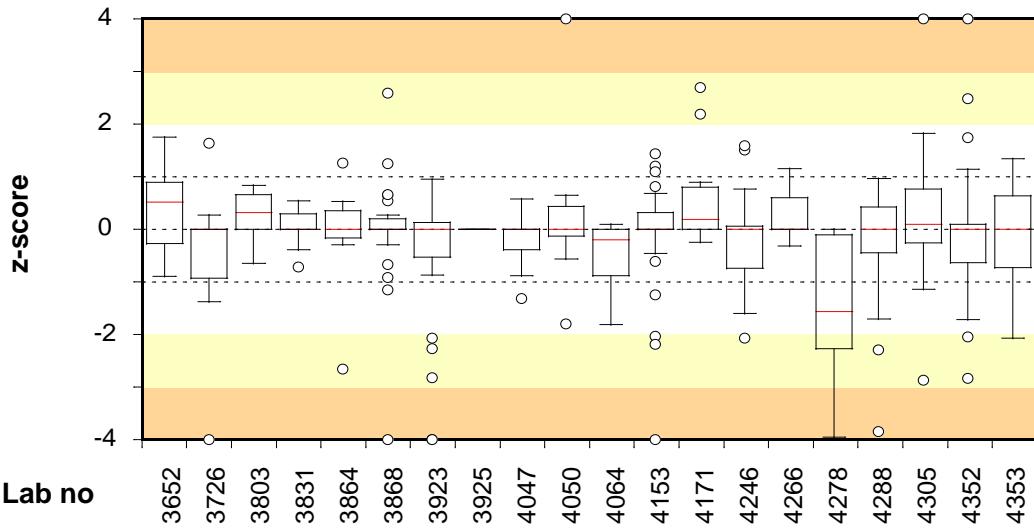

- *The plots are based on the laboratory results from all analyses (results of presumptive *B. cereus* mixture A excluded) transformed into z-scores calculated according to the formula: $z = (x-m)/s$, where x is the result of the individual laboratory, m is the mean of the results of all participating laboratories, and s is the standard deviation.*
- *The laboratory median value is illustrated by a horizontal red line in the box.*
- *The box includes 50% of a laboratory's results (25% of the results above the median and 25% of the results below the median). The remaining 50% are illustrated by lines and circles outside the box.*
- *Very deviating results are represented by circles and are calculated as follow: the lowest result in the box – $1.5 \times (\text{the highest result in the box} - \text{the lowest result in the box})$ or the highest result in the box + $1.5 \times (\text{the highest result in the box} - \text{the lowest result in the box})$. z-scores greater than +4 and less than –4 are positioned at +4 and –4, respectively, in the plot.*
- *The background is divided by lines and shaded fields to indicate ranges in order to simplify location of laboratory results.*

Appendix 1

Results from the participating laboratories

All results are expressed in \log_{10} cfu per ml sample.

Results reported as " $<\text{value}$ " have been regarded as zero (negative).

Results regarded as " $>\text{value}$ " are excluded in the calculations.

A dash in the table indicates that the analysis was not performed.

Outliers and false results are highlighted and summarized for each analysis in the end of the table.

Results from analysis of presumptive *B. cereus* i sample A, are neither included in the calculation of z-values nor the compilations of number of deviant results (Appendix 2 and figure 5).

n = number of performed analyses
 Min = lowest reported result
 Max= highest reported result
 Median = median value
 m = mean value
 s = standard deviation
 F+ = false positive
 F- = false negative
 Outl < = low outlier
 Outl > = high outlier
 L. value OK = lowest accepted value
 H. value OK = higest accepted value

Appendix 2.

z-scores of all participants

z-scores were calculated according the formula : $z = (x-m)/s$.

x = result of the individual laboratory

m = mean of the results of all participating laboratories

s = standard deviation of the results of all participating laboratories

Correct negative results in quantitative analyses obtained a z-score of zero.

False results did not generate a z-score.

 $2 < |z| \leq 3$, $|z| > 3$

1. Lunch och lärande – skollunchens betydelse för elevernas prestation och situation i klassrummet av M Lennernäs.
2. Kosttillskott som säljs via Internet – en studie av hur kraven i lagstiftningen uppfylls av A Wedholm Pallas, A Laser Reuterswärd och U Beckman-Sundh.
3. Vetenskapligt underlag till råd om bra mat i äldreomsorgen. Sammanställt av E Lövestram.
4. Livsmedelssvinn i hushåll och skolor – en kunskaps sammanställning av R Modin.
5. Riskprofil för material i kontakt med livsmedel av K Svensson, Livsmedelsverket och G Olafsson, Rikisendurskodun (Environmental and Food Agency of Iceland).
6. Proficiency Testing – Food Microbiology, January 2011 by C Normark and I Boriak
7. Proficiency Testing – Food Chemistry, Nutritional Components of Food, Round N 47.
8. Proficiency Testing – Food Chemistry, Trace Elements in Food, Round T-22 by C Åstrand and Lars Jorhem.
9. Riksprojekt 2010. Listeria monocytogenes i kyld ätfärdig mat av C Nilsson och M Lindblad.
10. Kontroll av restsubstanser i levande djur och animaliska livsmedel. Resultat 2010 av I Nordlander, Å Kjellgren, A Glynn, B Aspenström-Fagerlund, K Granelli, I Nilsson, C Sjölund Livsmedelsverket och K Girma, Jordbruksverket.
11. Proficiency Testing – Food Microbiology, April 2011 by C Normark, I Boriak, M Lindqvist and I Tillander.
12. Bär – analys av näringssämnen av V Öhrvik, I Mattisson, A Staffas och H S Strandler.
13. Proficiency Testing – Drinking Water Microbiology, 2011:1, March by T Slapokas, C Lantz and M Lindqvist.
14. Kontrollprogrammet för tvåskaliga blötdjur – Årsrapport 2009-2010 – av I Nordlander, M Persson, H Hallström, M Simonsson, Livsmedelsverket och B Karlsson, SMHI.
15. Margariner och matfettsblandningar – analys av fettsyror av R Åsgård och S Wretling.
16. Proficiency Testing – Food Chemistry, Nutritional Components of Food, Round N 48.
17. Kontroll av bekämpningsmedelsrester i livsmedel 2009 av A Jansson, X Holmbäck och A Wannberg.
18. Klimatpåverkan och energianvändning från livsmedelsförpackningar av M Wallman och K Nilsson.
19. Klimatpåverkan i kylkedjan – från livsmedelsindustri till konsument av K Nilsson och U Lindberg.
20. Förvara maten rätt så håller den längre – vetenskapligt underlag om optimal förvaring av livsmedel av R Modin och M Lindblad.
21. Råd om mat för barn 0-5 år. Vetenskapligt underlag med risk- och nyttovärderingar och kunskapsöversikter.
22. Råd om mat för barn 0-5 år. Hanteringsrapport som beskriver hur risk- och nyttovärderingar, tillsammans med andra faktorer, har lett fram till Livsmedelsverkets råd.
23. Proficiency Testing – Food Chemistry, Trace Elements in Food, Round T-23 by C Åstrand and L Jorhem.
24. Proficiency Testing – Food Chemistry, Vitamins in Food, Round V-9 by A Staffas and H S Strandler.
25. Nordiskt kontrollprojekt om nyckelhålmärkning 2011 av I Lindeberg.
26. Rapport från GMO-projektet 2011. Undersökning av förekomsten av GMO i livsmedel av Z Kurowska.
27. Fat Quality – Trends in fatty acid composition over the last decade by I Mattisson, S Trattner and S Wretling.
28. Proficiency Testing – Drinking Water Microbiology, 2011:2, September by T Slapokas and M Lindqvist.
29. Kontrollen roll skiljer sig mellan livsmedelsbranscherna av T Ahlström, G Jansson och S Sylvén.
30. Kommuner och Livsmedelsverkets rapportering av livsmedelskontrollen 2011 av C Svärd och L Eskilsson.
31. Proficiency Testing – Food Microbiology, October 2011 by C Normark and I Boriak.

1. Fisk, skaldjur och fiskprodukter – analys av näringssämnen av V Öhrvik, A von Malmborg, I Mattisson, S Wretling och C Åstrand.
2. Normerande kontroll av dricksvattenanläggningar 2007-2010 av T Lindberg.
3. Tidstrender av tungmetaller och organiska klorerade miljöföroringar i baslivsmedel av J Ålander, I Nilsson, B Sundström, L Jorhem, I Nordlander, M Aune, L Larsson, J Kuivinen, A Bergh, M Isaksson och A Glynn.
4. Proficiency Testing – Food Microbiology, October 2011 by C Normark, I Boriak and L Nachin.
5. Mögel och mögelgifter i torkad frukt av E Fredlund och J Spång.
6. Mikrobiologiska dricksvattenrisker ur ett kretsloppsperspektiv – behov och åtgärder av R Dryselius.
7. Market Basket 2010 – chemical analysis, exposure estimation and health-related assessment of nutrients and toxic compounds in Swedish food baskets.
8. Proficiency Testing – Food Microbiology, April 2012 by L Nachin ,C Normark, I Boriak and I Tillander.
9. Kontroll av restsubstanser i levande djur och animaliska livsmedel. Resultat 2010 av I Nordlander, Å Kjellgren, A Glynn, B Aspenström-Fagerlund, K Granelli, I Nilsson, C Sjölund Livsmedelsverket och K Girma, Jordbruksverket.
10. Råd om fullkorn 2009 – bakgrund och vetenskapligt underlag av W Becker, L Busk, I Mattisson och S Sand.
11. Nordiskt kontrollprojekt 2012. Märkning av allergener och ”kan innehålla spår av allergener” – resultat av de svenska kontrollerna av U Fäger.
12. Proficiency Testing – Drinking Water Microbiology, 2012:1, March by T Slapokas, M Lindqvist and K Mykkänen.
13. Länsstyrelsens rapportering av livsmedelskontroll inom primärproduktionen 2010-2011 av L Eskilsson och K Bäcklund Stålenheim.
14. Vetenskapligt underlag för råd om mängden frukt och grönsaker till vuxna och barn av H Eneroth.
15. Kommuner och Livsmedelsverkets rapportering av livsmedelskontrollen 2011 av L Eskilsson.
16. Sammanställning av resultat från en projektinriktad kontrollkurs om skyddade beteckningar 2012 av P Elvingsson.
17. Nordic Expert Survey on Future Foodborne and Waterborne Outbreaks by T Andersson, Å Fulke, S Pesonen and J Schlundt.
18. Riksprojekt 2011. Kontroll av märkning – redlighet och säkerhet av C Spens, U Colberg, A Göransdotter Nilsson och P Bergkvist.
19. Från nutritionsforskning till kostråd – så arbetar Livsmedelsverket av I Mattisson, H Eneroth och W Becker.
20. Proficiency Testing – Food Microbiology, October 2012 by L Nachin ,C Normark and I Boriak.
